

Per-slice paired differences on the full validation set (n = 7,334 slices)

■ $\Delta > 0$: slice favors the replacement ■ $\Delta < 0$: slice favors the baseline

(a) Controlled substitution: SS2D vs. GRU

(b) Enhanced SS2D vs. controlled SS2D

Signs are oriented so that positive always favors the replacement (NMSE/L1 differences are negated). x-axes span the 99.5th percentile of $|\Delta|$ per panel; the $\leq 0.5\%$ of slices beyond this range are not shown.
